

Abstrakt v anglickém jazyce

This thesis characterises legal regulation of plants and animals protection. In the last decades, there is an increasing loss of biological diversity, which mainly results from human activities. It is therefore necessary to create legal measures that will eliminate the causes of threats to biodiversity and prevent the loss of animals and plants. The purpose of my thesis is to analyse some of the selected most important measures. The thesis is composed of four chapters. Part one describes biological diversity of the Czech republic and the causes of threats to biological resources. Chapter two examines relevant legislation and main approach to legal protection. Part three concentrates on the selected most important legal measures, which are subdivided into conceptual, administrative, economic and voluntary measures. Chapter four describes the conclusions.
